

Web IDEA Access Level Changes

In the Web IDEA database, we currently have 9 potential access levels. We are currently using only 6 of these levels. Currently, when you setup a staff person in IMS with access to the Web IEP, you select an access level. Staff is the lowest level currently available.

In Version 4, the student lists were generated for this level of user by looking at the IMS Services for this staff person. In Version 5, in order to make this level work correctly, we had to also add IMS Departments to the Building list query for this level of user.

This is why for some users who have had an access level change, possibly from Building to Staff, may have had buildings listed twice in their selection list. You would have had to end either a service or a department record to remove the duplicate.

In preparation for the Web IFSP, we will be proposing to the OGC that we activate one of the three unused access levels. We will also be restructuring two of our current access levels.

What the recommended change will do is split the Staff level into two access levels. The first Staff level will only look at IMS Services to generate the Building list. The second Staff Level will look at both IMS Services and IMS Departments to generate the Building List.

When you want the Staff level to generate the Building List by using both IMS Services and IMS Departments, you may need to check a box. This change will not be programmed until our proposal is accepted. So the indication method may turn out differently. But here is an example of how this could be designed. There may be a check box, similar to "Use Departments" added to the Web IEP area. Checking this box, would mean the list of buildings available to Staff access level users would look at both Services and Departments to determine the visible buildings for that individual staff.
